

~~SECRET NOFORN~~

There are three coastal defense cruise missile sites

Cuba. Each site has two launchers and probably eight missiles. The range of the missile is believed to be fairly short--below 30 n.m. There is some possibility that the missiles have a greater range, however. These weapons could carry nuclear warheads.

There are 22 SAM sites in Cuba with six launchers at each site. The system is believed to be equipped with the SA-2 missile which has some effective altitude capability up to 80,000 feet. It is believed most effective between altitudes of 5,000 and 60,000 feet at slant ranges out to 25 n.m. This missile does not carry a nuclear warhead.
